# \*\*ENTUCKY FORESTS

ULS, DET. 1990 LOTE WATTONAL AGE.C. LIUPAL LIBITARY

SEP 10 1960

Western Coalfield Unit

#9

#### **FOREWORD**

More than a decade has elapsed since the last comprehensive inventory of Kentucky's woodlands. Timber cutting, tree growth, and shifts in land use since then have led to several important changes in the timber resource. The demand for forest products has also changed. Recent emphasis on rural area development has made the necessity for fresh statistics even more pressing. Local communities and forest-based industries are finding a greater need for up-to-date data as they plan for future economic development. So, there is an urgent need for new information.

To meet these needs, the Division of Forestry of the Kentucky Department of Natural Resources and the U.S. Forest Service planned and conducted a new inventory of Kentucky forests. The field work was completed in 1964.

The McSweeney-McNary Forest Research Act of 1928 authorizes the Forest Service to complete a statewide forest inventory of Kentucky at approximate 10-year intervals. This is part of the nationwide program of maintaining a current account of our timber resources. The State of Kentucky appropriated \$120,000 for the current survey. This contribution, supplementing the Federal funds available for a regular survey, made it possible to intensify the inventory. As a result, we can provide the kind of detailed information needed for making long-range plans to meet future demands and in addition help local communities and forest-based industries make more efficient use of the forest resource.

Clarence D. Chase, Leader of the Survey Project at the Lake States Forest Experiment Station, directed the inventory. Field survey units of the Kentucky Division of Forestry and the Lake States Station collected the basic inventory data. The Lake States Station computed and tabulated the final statistics and the Central States Forest Experiment Station analyzed and reported the results.

Other organizations made important contributions to the new inventory. Personnel of the Eastern Region of the U.S. Forest Service inventoried and provided statistics for the Cumberland National Forest. The Northeastern Forest Experiment Station assisted with the computation of National Forest data. The Tennessee Valley Authority provided men and equipment to assist in surveying areas of their interest. The Soil Conservation Service and the Agricultural Stabilization and Conservation Service provided the field crews with office space and up-to-date aerial photographs. The Kentucky Department of Highways took and provided aerial photographs for parts of eastern Kentucky where no recent photographs were available. The University of Kentucky and Kentucky Department of Commerce took an active part in planning and gave valuable assistance with problems that evolved during the course of the inventory. Our thanks go to all these organizations and others who contributed.

For sampling and reporting purposes, the State was divided into seven survey units (frontispiece). This report covers the Western Coalfield Unit. Additional information regarding the survey can be obtained from either the Division of Forestry, Kentucky Department of Natural Resources, or the Central States Forest Experiment Station.

Location of the Western Coalfield Unit in Kentucky.

#### THE TIMBER RESOURCE HAS CHANGED

The 20-county Western Coalfield Unit is probably best known for its mineral and agricultural production. Each year large amounts of coal, petroleum, and other mineral products are taken from the region. And since the topography here is less rugged than that found further east, most of the land is farmed. However, about 1.9 million acres or one-third of the total land area of the region is forested and this forest contributes its share to State and local economies. The current annual harvest of timber in the Western Coalfield is greater than in any other survey unit of Kentucky.

All but about 56,000 acres or 3 percent of the region's forest is classified commercial. The bulk of the noncommercial forest is found in Mammoth Cave National Park where woodlands are reserved from cutting.

Commercial forest area has increased about 5 percent from 1,750,000 to 1,843,000 acres since 1949, with gains occurring in 13 of the 20 counties (fig. 1). Counties in the central part of the region are more heavily forested than those to the north and south where the land surface is more level and better suited to agriculture. Sixty percent of the land area in Edmonson County is forested, making it the most heavily wooded county in the region. At the other extreme is Simpson County which is only 15 percent forested.

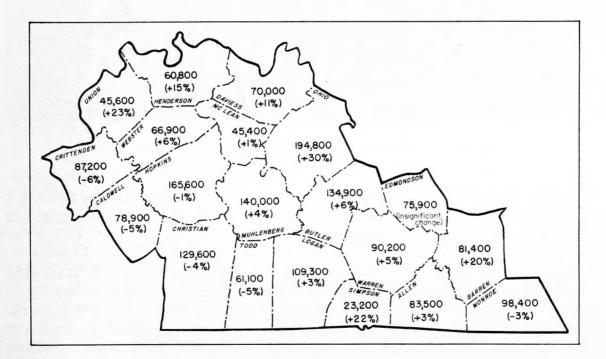

FIGURE 1. — Acreage of commercial forest land by county, 1963, and percentage change since 1949.

The general pattern of woodland ownership has not changed significantly since the last survey. Acreages of commercial forest land in public and private ownerships have both increased but private holdings still account for almost 99 percent of the total (fig. 2).

FIGURE 2. — Practically all of the commercial forest is privately owned, most of it in farm woodlands.

Oddly enough, the increase in forest area was accompanied by a decline in total timber volume. Since 1949, growing-stock volume has decreased about 2 percent to 1,157 million cubic feet.<sup>1</sup>

Much of the gain in forest area was a result of abandoned fields and pastures becoming restocked with trees. The small volume of growing stock added to the inventory by these new, immature forests plus the natural growth occurring on all stands have not been enough to offset losses from timber harvests, forest-land clearing, and mortality. The present average of 628 cubic feet of growing stock per acre is 44 cubic feet less than in 1949.

<sup>&</sup>lt;sup>1</sup> The 1949 estimates of growing-stock volume are not directly comparable with those of 1963 because they did not include merchantable material in the upper-stem portion of hardwood sawtimber-size trees. The 1949 data had to be adjusted to permit comparisons.

While the total volume of growing stock declined, significant increases took place in the volume of trees 11 to 19 inches d.b.h. (fig. 3). Most of the cut in the immediate future will come from these trees which are beginning to develop quality growth. The volume of sawtimber increased 476 million board feet or 13 percent between surveys. This amounted to an average annual gain of 11 board feet per acre. Because most of the volume increase occurred on trees 11 to 19 inches in diameter, there has been a shift in the distribution of sawtimber volume by size class. In 1949, two-thirds of the sawtimber volume was in trees less than 19.0 inches d.b.h. and now more than three-fourths of the volume is in these sizes.

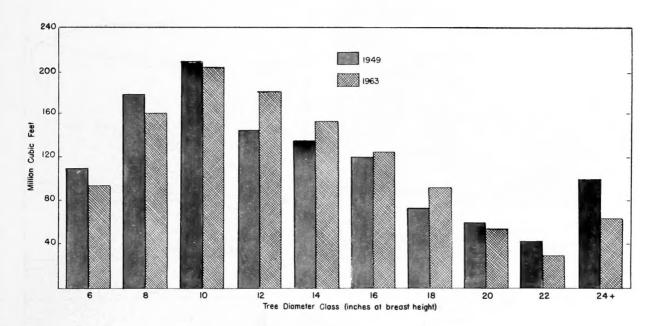

FIGURE 3. — Change in volume of growing stock by diameter class, 1949-1963.

Species composition of the region's forests has also changed somewhat, but oaks and hickories still account for more than half the total volume of growing stock. Most of the remaining volume is well distributed among several hardwood species (fig. 4). The sawtimber volume of some heavily used species such as oak, hickory, yellow-poplar, and soft maple increased between surveys, while that of beech and sweetgum declined (fig. 5).

#### TIMBER INDUSTRIES AND DRAIN

In 1962, almost 34 million cubic feet of growing stock were cut from the Western Coalfield Unit. This was more than one-fourth of the total cut in Kentucky during that year. The regional harvest, averaging about 18 cubic feet per commercial forest acre, was greater than in any other survey unit of the State (fig. 6).

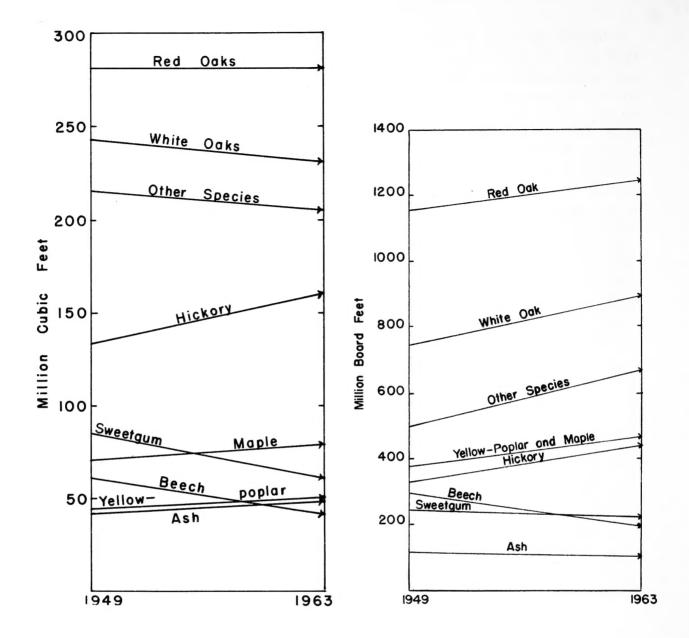

FIGURE 4. — Change in growing-stock volume by species groups, 1949-1963.

FIGURE 5. — Change in sawtimber volume by species groups, 1949-1963.

Nearly 100 primary wood-using firms are active in the region; most of them are lumber-producing sawmills (fig. 7). Some of Kentucky's largest mills are found here. Lumber production in 1962 totaled 142 million board feet, averaging well over 1 million board feet per mill. Among the region's other primary firms are six cooperage mills and three handle plants. These mills consumed less than 10 million board feet of timber but used high-quality white oak, ash, and hickory logs.

FIGURE 6. — The cut of timber per commercial forest acre averages higher here than in any other region of Kentucky.

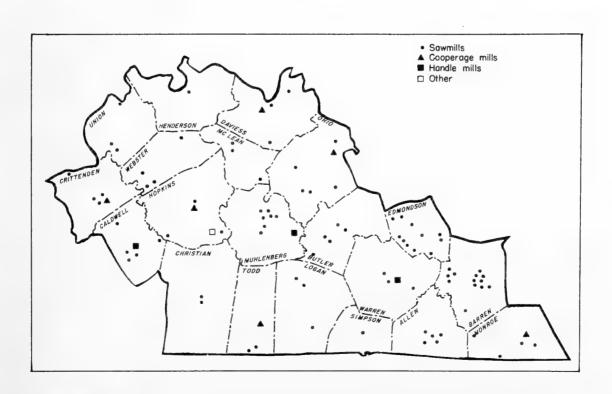

FIGURE 7. — Location of primary wood-using industries, 1963.

Almost nine-tenths of the growing stock cut in 1962 was from trees of sawtimber size. The harvest of saw log volume amounted to 189 million board feet and about half the sawtimber cut was from oak species. Yellow-poplar, beech, hickory, soft maple, and sweetgum ranked next in order of importance and together accounted for another third of the sawtimber cut. Most of the sweetgum and soft maple timber harvested in Kentucky came from this region.

#### THE CURRENT BALANCE BETWEEN GROWTH AND CUT

The current net annual growth of growing stock in the Western Coalfield Unit is about 53 million cubic feet, or 4.5 percent of the inventory before allowances are made for cutting. Sawtimber volume is growing at a rate of 278 million board feet or 6.6 percent per year. Annual growth averages about 29 cubic feet of growing stock and 151 board feet of sawtimber per acre.

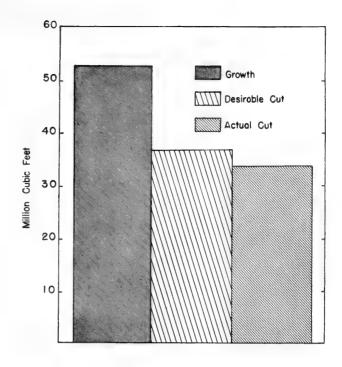

The above growth rates are well below the potential of the region's forests. Virtually all the Western Coalfield woodland has the capacity to produce more than 50 cubic feet per acre per year (potential expressed in terms of mean annual growth at culmination of increment in fully stocked stands of desirable trees). But significant increases in productivity will not occur until stocking improves. Too many culls and poor growing-stock trees are occupying space that could be growing thrifty crop trees.

At present, only one-third of the commercial forest is well stocked with merchantable or potentially merchantable trees. And only 15 percent of all stands are in a highly productive condition; i.e., well stocked with desirable trees or expected to attain such stocking in the near future.

A comparison of current annual growth with the cut recorded in 1962 indicates a net annual increase in timber volume, but the rate of increase is much lower here than in other parts of Kentucky (fig. 8). Regional growth rates are about average for the State, but cutting rates are much higher than average. As a result, the volumes of total growing stock and sawtimber are each increasing only about 2 percent per year.

The excess of growth over cut is greatest in the smaller size classes; the ratio of volume growth to volume cut for poletimber being about 5 to 1. Growth exceeds cut for most species, but a few important timber species such as the select red oaks, beech, black walnut, and cottonwood are being cut at a faster rate than they are growing.

FIGURE 8. — Growth, desirable cut, and actual cut of growing stock, 1963.

#### MORE TIMBER CAN BE HARVESTED

A desirable cut of more than 36 million cubic feet of growing stock has been estimated for the Western Coalfield Unit. This is the volume that should be removed annually during the next decade in harvest cuts and commercial thinnings. The aim of the desirable cut is to improve timber productivity with the long-range goal of establishing a regulated forest producing a sustained yield of timber. The desirable cut provides a recommended silvicultural standard that can be compared with current cutting to show where shortages and surpluses occur in the timber supply.

In this region, the desirable cut of all growing stock exceeds the current actual cut (that made in 1962) by 3 million cubic feet (fig. 8). But the current cut of sawtimber volume is greater than the recommended cut by about 46 million board feet and this is the size timber that is in greatest demand (fig. 9). The desirable cut of poletimber volume exceeds the actual cut by some 8 million cubic feet, indicating that if markets were available, nearly 3 times as much poletimber volume could be harvested annually.

For many species, it would be silviculturally desirable to reduce the cut of large timber until the stocking improves. A surplus of desirable cut over actual cut exists for a few important species such as the white oaks and hickory, suggesting that more of this timber can be harvested. But deficits are found for most other species (fig. 10).

FIGURE 9. — In 1962, the cut of large timber from the region exceeded recommended levels.

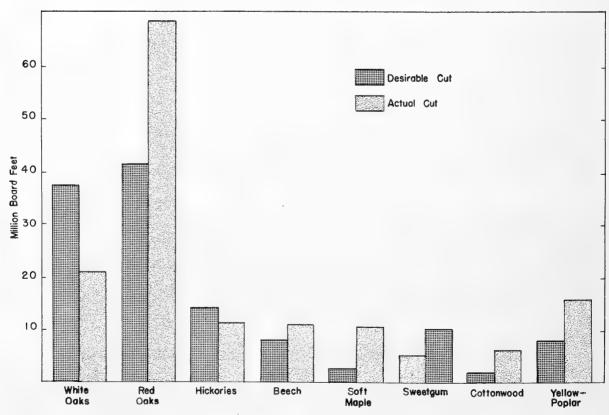

FIGURE 10. — Desirable cut and actual cut of sawtimber for selected species, 1963.

#### APPENDIX

#### **Forest Survey Procedure**

The resource statistics presented in this report were obtained from a sampling survey. The survey was designed to yield reliable statistics for large areas. It combined aerial photo interpretation and field work to minimize costs. Electronic data-processing machines were employed to reduce computing time and generate more usable statistics than could be done by hand methods.

To attain specific levels of statistical accuracy, triple sampling was used. A large number of points were first examined on aerial photographs to determine the proportions of forest and nonforest land. One-fourth of the forest points were stereoscopically classified as to forest type, stand size, stocking, and site. One-twelfth of these points were in turn examined on the ground. The ground classification provided a check on photo classification and a means of improving estimates of forest area.

At each forest ground-check point a plot was established. Trees were classified and measured as a basis for estimating timber volume, growth, mortality, and quality. Ownership was determined for each plot.

Timber-cut information was based on forest-industry production records for 1962, on stump counts at forest-inventory plots, cutting records from large owners, and utilization factors based on a logging-residue study.

#### **Accuracy of Survey Estimate**

Estimates of forest area and timber volume are subject to two kinds of errors: (1) nonsampling errors caused by mistakes in judgment, recording of measurements, or in calculations, and (2) sampling errors inherent in statistical work.

Nonsampling errors are not measurable and cannot be shown. They are avoided as much as possible through training of personnel, close supervision, and careful checking of all phases of the work.

Sampling errors are subject to the laws of chance and may be estimated by statistical methods. These errors are held to acceptable levels commensurate with the values involved and funds available by adjusting the survey design and the intensity of the sample. With a probability of two out of three (that is, relatively good) the accompanying table shows the accuracy of the data presented in this report. The sampling error of a survey is less for a large class or block than for a smaller class or other subdivision. Some of the resource statistics presented in this report have such large errors that it would be unwise to use them alone — but if they are combined with other figures the error may be reduced enough to warrant their use. Weak figures are shown to allow various combinations of data.

Commercial- forest land	Standard error of sampling	Growing-stock volumes	Standard error of sampling	Sawtimber volumes	Standard error of sampling
Acres	Percent	Thousand cu. ft.	Percent	Thousand bd. ft.	Percent
1,842,700	2.1	1,157,280	4.0	4,234,700	5.9
1,000,000	3.2	1,000,000	4.5	1,000,000	12.2
500,000	4.5	500,000	6.4	500,000	17.2
300,000	5.8	300,000	8.2	300,000	22.2
100,000	10.0	100,000	14.2	100,000	38.4
50,000	14.1	50,000	20.2	50,000	54.4
30,000	18.2	30,000	26.0	30,000	70.2
10,000	31.5	10,000	45.1	10,000	121.6
5,000	44.6	5,000	63.7		
3,000	57.5				

The occurrence of a (—) in the statistical tables of this report indicates one of two things:

- (1) No units were measured by the inventory.
- (2) The quantity of data measured was insignificant and did not warrant reporting.

#### **Definition of Terms**

#### Land and Forest Area

Gross area. — The entire area of land and water as determined by the Bureau of the Census.

Land area. — The area of dry land and land temporarily or partially covered by water such as marshes, swamps, and flood plains; streams, and sloughs less than  $\frac{1}{8}$  mile wide; and lakes, reservoirs, and ponds less than 40 acres in area.

Forest land. — Land at least 10 percent stocked by forest trees of any size, or formerly having such tree cover and not currently developed for nonforest use. Does not include urban or thickly settled residential and resort areas, city parks, orchards, farmsteads, improved roads, or land developed and maintained for nonforest use by fencing, seeding, and so forth. The minimum area for classification of forest land or classes of forest land was 1 acre. Roadside, streamside, and shelterbelt strips of timber having a crown width of at least 120 feet qualified as forest land. Unimproved roads and trails, streams, and clearings in forest land were included as forest if less than 120 feet wide.

Commercial-forest land. — Forest land that is producing or capable of producing crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation.

Noncommercial-forest land. — Unproductive forest land incapable of yielding crops of industrial wood because of adverse site conditions; and productive, public-forest land withdrawn from commercial timber use through statute or administrative regulation.

#### Ownership

Public. — All publicly owned land other than National Forest.

Forest industry. — Land owned by companies or individuals operating wood-using plants.

Farmer and miscellaneous private. — All privately owned land except forest industry land.

#### Forest Types

Forest type. — A classification of forest land based upon species composition considering all live trees.

Southern pine. — Forests in which 50 percent or more of the stocking is shortleaf or other southern yellow pines, singly or in combination.

*Redcedar-hardwoods.*— Forests in which 50 percent or more of the stocking is hardwoods but in which redcedar makes up at least 25 percent of the stocking. Included also are those areas where redcedar makes up most of the stocking.

*Oak-pine*. — Forests in which 50 percent or more of the stocking is hardwoods (usually upland oaks) but in which southern pine makes up at least 25 percent of the stocking.

White oak. — Forests in which 50 percent or more of the stocking is white oak, except stands that classify as redcedar-hardwoods or oak-pine.

*Oak-hickory*. — Forests in which 50 percent or more of the stocking is upland oaks or hickories, singly or in combination, except stands that classify as oak-pine, redcedar-hardwoods, or white oak.

Central mixed hardwoods. — Forests in which 50 percent or more of the stocking is a combination of hardwood species, principally yellow-poplar, maple, beech, basswood, black walnut, elm, and northern red oak, except stands that classify as redcedar-hardwoods, oak-pine, oak-hickory, maple-beech, or elm-ash-cottonwood.

*Maple-beech*. — Forests in which 50 percent or more of the stocking is maple or beech, singly or in combination, except stands that classify as redcedar-hardwoods or oak-pine.

Oak-gum-cypress. — Bottomland forests in which 50 percent or more of the stocking is blackgum, sweetgum, oak, or southern cypress, singly or in combination, except stands that classify as oak-pine.

*Elm-ash-cottonwood*. — Forests in which 50 percent or more of the stocking is elm, ash, or cottonwood, singly or in combination except stands that classify as redcedar-hardwoods or oak-pine.

#### Stand-Size Classes

Stand-size class. — A classification of forest land based on the predominant size of timber present-sawtimber, poletimber, or seedlings and saplings.

Sawtimber stands. — Stands at least 10 percent stocked with growing-stock trees, with half or more of this stocking in sawtimber or poletimber trees and with sawtimber stocking at least equal to poletimber stocking.

*Poletimber stands.* — Stands at least 10 percent stocked with growing-stock trees, and with half or more of this stocking in sawtimber and/or poletimber trees and with poletimber stocking exceeding that of sawtimber.

Seed ling-sapling stands. — Stands at least 10 percent stocked with growing-stock trees and with seedlings and/or saplings comprising more than half of this stocking.

Nonstocked areas. — Commercial-forest land less than 10 percent stocked with growing-stock trees.

#### Stocking Classes

Stocking class.—A classification of commercial-forest land based on the percent of area occupied by growing-stock trees. Growing-stock trees include all live trees except culls.

Well stocked. — Stands that are 70 percent or more stocked with growing-stock trees.

Medium stocked. — Stands that are 40 to 69 percent stocked with growing-stock trees.

*Poorly stocked.* — Stands that are from 10 to 39 percent stocked with growing-stock trees.

Nonstocked. — Areas of commercial-forest land not qualifying as saw-timber, poletimber, or seedling and sapling stands. These areas may contain some volume but less than 10 percent of the growing space is effectively utilized by growing stock.

#### Area-Condition Classes

A classification of commercial-forest land based upon stocking by desirable growing-stock trees and conditions affecting current and prospective timber growth. Desirable growing-stock trees are those that have no serious defects in quality limiting present or prospective use. They have relatively high vigor and contain no pathogens that may result in death or serious deterioration before rotation age. These are the trees that would be favored in silvicultural operations.

Desirable. — Areas 70 percent or more stocked with desirable trees.

*Moderate and favorable.*— Areas 40 to 70 percent stocked with desirable trees and with 30 percent or less of the area having other trees and/or inhibiting vegetation or surface conditions that will prevent occupancy by desirable trees.

*Moderate and unfavorable.*— Areas 40 to 70 percent stocked with desirable trees and with more than 30 percent of the area having other trees and/or inhibiting vegetation or surface conditions that will prevent occupancy by desirable trees.

*Poor but favorable.* — Areas less than 40 percent stocked with desirable trees and with 30 percent or less of the area having other trees and/or inhibiting vegetation or surface conditions that prevent occupancy by desirable trees.

*Poor and unfavorable.*— Areas less than 40 percent stocked with desirable trees and with more than 30 percent of the area having other trees and/or inhibiting vegetation or surface conditions that prevent occupancy by desirable species.

#### $Volume\ Classification$

Growing-stock volume. — Cubic-foot volume of sound wood in the bole of sawtimber and poletimber trees from the stump to a minimum 4-inch-top diameter outside bark or to the point where the central stem breaks into limbs.

Sawtimber volume. — Net volume of the saw-log portion of live saw-timber trees in board feet, International ¼-inch rule. The saw-log portion extends from stump to a minimum top diameter outside bark of 6 inches for softwoods and 8 inches for hardwoods or to the point where defects reduce saw-log quality below Standard Log Grade 3 or Tie-and-Timber Grade.

#### Tree-Size Classes

Sawtimber trees. — Live trees of commercial species containing at least an 8-foot saw log. Softwoods must be at least 9 inches and hardwoods at least 11 inches d.b.h. outside bark.

Poletimber trees. — Live trees of commercial species at least 5 inches d.b.h. but smaller than sawtimber size, and of good form and vigor.

Saplings. — Live trees of commercial species 1 to 5 inches d.b.h. and of good form and vigor.

Seedlings. — Live trees of commercial species less than 1 inch d.b.h. that are expected to survive.

#### Growth

Net annual growth.— The annual change in volume of sound wood in live sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth less volume losses resulting from natural causes.

Growing-stock growth. — Net annual growth of poletimber and saw-timber trees in cubic feet.

Sawtimber growth. — Net annual growth of sawtimber trees in board feet, International ¼-inch rule.

#### Timber Cut

Timber cut from growing stock. — The net cubic-foot volume of sound wood in live sawtimber and poletimber trees cut for forest products during a specified year, including both roundwood products and logging residues.

Timber cut from sawtimber. — The net board-foot volume of live sawtimber trees cut for forest products during a specified year, including both roundwood products and logging residues.

Desirable cut (formerly called allowable cut). — The net volume of live sawtimber and poletimber trees that can be cut annually during the next 10 years in commercial-logging operations while maintaining or increasing growing stock and while effecting a reasonably even distribution of age classes below the rotation age selected for each type. It includes harvest and improvement cuts yielding 3 cords or more per acre, and one-tenth of the entire net volume of stands 10 or more years beyond the rotation age. Desirable cut includes all timber of merchantable size that should be cut from commercial-forest land in order to salvage, rejuvenate, or improve the stands and increase the growth without regard to restraints of ownership, inaccessibility, or the profit motive. Some of this timber may not be available for sale, too hard to get at or too scattered, or of currently unwanted species or quality. More forest products may be obtained by reducing the "forest capital."

# $\frac{\textit{Rotation ages for saw-log trees in extensively managed stands}}{\textit{by forest-type and site-index classes}}$

(In years)

<b>.</b>	Site index (50-year height in feet)*								
Forest type	40	50	60	70	80	90	100+		
Southern pine	120	110	90						
Redcedar-hardwoods	120	110	90						
Oak-pine	120	110	90						
White oak	120	110	90	80	75	70			
Oak-hickory	120	110	90	80	75	70			
Central mixed hardwoods		110	90	80	75	70	60		
Maple-beech		100	100	100	100				
Oak-gum-cypress				80	75	70	60		
Elm-ash-cottonwood†				80	70	60	60		

<sup>\*</sup> Except in the case of cottonwood for which it is total height at 25 years.

#### Miscellaneous Definitions

Site class. — A classification of commercial-forest land based on potential yields in cubic feet per acre of mean annual growth at culmination of increment in fully stocked stands of desirable trees.

D.b.h. (Diameter at breast height). — Tree diameter in inches measured outside the bark at a point  $4\frac{1}{2}$  feet above the ground.

Diameter class. — Where data are presented in 2-inch diameter classes, they include diameters from 1.0 inches below to 0.9 inches above the stated midpoint; e.g., trees 5.0 inches to and including 6.9 inches, are included in the 6-inch class.

<sup>†</sup> The rotation for cottonwood is half of the age shown.

### Principal Commercial Tree Species of Kentucky<sup>2</sup>

#### **Softwood Species**

	Taxodium distichum (L.) Rich.
Hemlock (eastern)	Tsuga canadensis (L.) Carr.
Pine group includes —	
Shortleaf pine	Pinus echinata Mill.
Other yellow pines:	
Pitch pine	P. rigida Mill.
Virginia pine	P. virginiana Mill.
White pine (eastern)	P. strobus L.
Redcedar (eastern)	Juniperus virginiana L.

#### Hardwood Species

Ash	Fraxinus L. species
	Tilia L. species
Beech (American)	Fagus grandifolia Ehrh.
Birch (yellow)	Betula alleghaniensis Britton
Blackgum	
Black walnut	Juglans nigra L.
Cottonwood (eastern)	Populus deltoides Bartr.
Hickory	
Maple (hard) includes —	
Black maple	Acer nigrum Michx. f.
Sugar maple	A. saccharum Marsh.
Maple (soft) includes —	
Boxelder	
Red maple	
Silver maple	A. saccharinum L.
Oak group includes —	
Select red oaks:	
	Quercus falcata var. pagodaefolia Ell.
	Q. rubra L.
	Q. shumardii Buckl.
Other red oaks:	
Black oak	•
	Q. palustris Muenchh.
	Q. coccinea Muenchh.
	Q. imbricaria Michx.
	Q. falcata Michx.
	Q. nigra L.
Willow oak	Q. phellos L.

<sup>&</sup>lt;sup>2</sup> The common and scientific names are based on: Little, Elbert L., Jr. CHECK LIST OF NATIVE AND NATURALIZED TREES OF THE UNITED STATES (INCLUDING ALASKA). U.S. Dept. Agr. Handb. 41, 472 pp. 1953.

Select white oaks:	
Bur oak	Q. macrocarpa Michx.
	Q. muehlenbergii Engelm.
Swamp chestnut oak	Q. michauxii Nutt.
Swamp white oak	Q. bicolor Willd.
White oak	Q. alba L.
Other white oaks:	
Chestnut oak	Q. prinus L.
	Q. lyrata Walt.
Post oak	Q. stellata var. stellata Wangenh.
Sweetgum	Liquidambar styraciflua L.
	Liriodendron tulipifera L.
Other hardwoods includes —	
Birch (river)	Betula nigra L.
Buckeye (yellow)	
	Juglans cinerea L.
	Prunus serotina Ehrh.
	Gymnocladus dioicus (L.) K. Koch.
Cucumbertree	Magnolia acuminata L.
- '	Cornus florida L.
	Ulmus L. species
	Celtis occidentalis L.
· ·	Gleditsia triacanthos L.
	Robinia pseudoacacia L.
	Maclura pomifera (Raf.) Schneid.
	Diospyros virginiana L.
	Sassafras albidum (Nutt.) Nees
	Platanus occidentalis L.
Willow (black)	Salix nigra Marsh.

#### Statistical Tables

The following tables present forest-resource data for the Western Coalfield Unit and each of its 20 counties. Tables 1-7 contain information on land and forest area; tables 8-12 information on numbers of trees and timber volume; and tables 13-18 information on growth, cut, and desirable cut. Data for individual counties are shown in tables 1, 4, 10, 14, and 18.

Table 1.--Area of land and forest land by counties
Western Coalfield Unit, Kentucky, 1963

	1			Forest land			
County	Gross area*	Land area*	All forest	Non- commercial	Commercial	as a percent of land area	
	Acres	Acres	Acres	Acres	Acres	Percent	
Allen	233,000	233,000	83,800	300	83,500	35.8	
Barren	311,000	311,000	83,600	2,200	81,400	26.2	
Butler	283,500	283,500	135,500	600	134,900	47.6	
Caldwell	228,500	228,500	79,200	300	78,900	34.5	
Christian	464,600	464,600	131,400	1,800	129,600	27.9	
Crittenden	240,600	233,600	87,800	600	87,200	37.3

# THE AUTHORS

PAUL S. DeBALD recently transferred to the Central States Forest Experiment Station from the Lake States Station where he began his Forest Service career in 1959. DeBald is experienced in all phases of Forest Survey work. Born in Pittsburgh, Paul graduated in forestry from the Pennsylvania State University. He is a member of the Society of American Foresters, Tau Phi Delta (professional forestry fraternity), and Xi Sigma Pi (honorary forestry society).

DAVID A. GANSNER began his Forest Service career in 1958 at the Lake States Forest Experiment Station, working on the Forest Survey in Missouri and Minnesota. In 1961 he moved to the Central States Station and his present job as Forest Survey Representative. A native of Missouri, Dave received his degree in forestry from the University of Missouri. He is a member of the Society of American Foresters, Xi Sigma Pi (honorary forestry society), and Gamma Sigma Delta (agricultural honor society).
